

The Dura-Wrap Cargo Tanker Leak Repair Kit

1/2020

The Corrosion Shield CSI-DuraWrap System for repairing leaking Cargo tanker found during offload or loading.

This Dura-Wrap system is a temporary fix in chemical situations where a vessel leak is found during loading or unloading and is not an emergency situation, but aids in the safe offloading of the chemical so that the vessel can then be taken to the repair shop for additional inspection and DOT required repair.

No warranties are implied.

If the situation cannot be handled per the DOT Hazmat required technical procedures, do not attempt to use this repair material and consult the Vehicle owner or Chemical company.

Engineered CSI-DuraWrap Stop Leak System

The DuraWrap repair system has several different uses depending on the type of leak.
No pressure shall be in the vessel while attempting to make a repair.

Barrel leak: Uses fast curing epoxy and patch to seal the weeping leak.

Piping Leak: uses silicone tape and fast curing epoxy to seal the leak

Fitting leak: Uses pre-shaped fitting to bond to fitting for quick and fast cure.

See the attached sheet for specific guide to repair each type of leak.
